

FIGURE 01

From flexible computing to power-system value

Study design | Workload constraints, incentives and system outcomes

a AI workload

Training

Batch inference

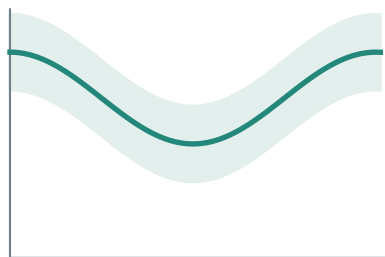

Real-time inference

Different completion deadlines

b Feasible response

Power response envelope

Delay / migration / recovery

Bounded by service guarantees

c Operating choices

— Rigid baseline

- - - Private operation

— System coordination

Same workload and reliability

d System outcomes

□ Investment avoided

□ Emissions avoided

□ Reliable capacity

Net of delivery costs

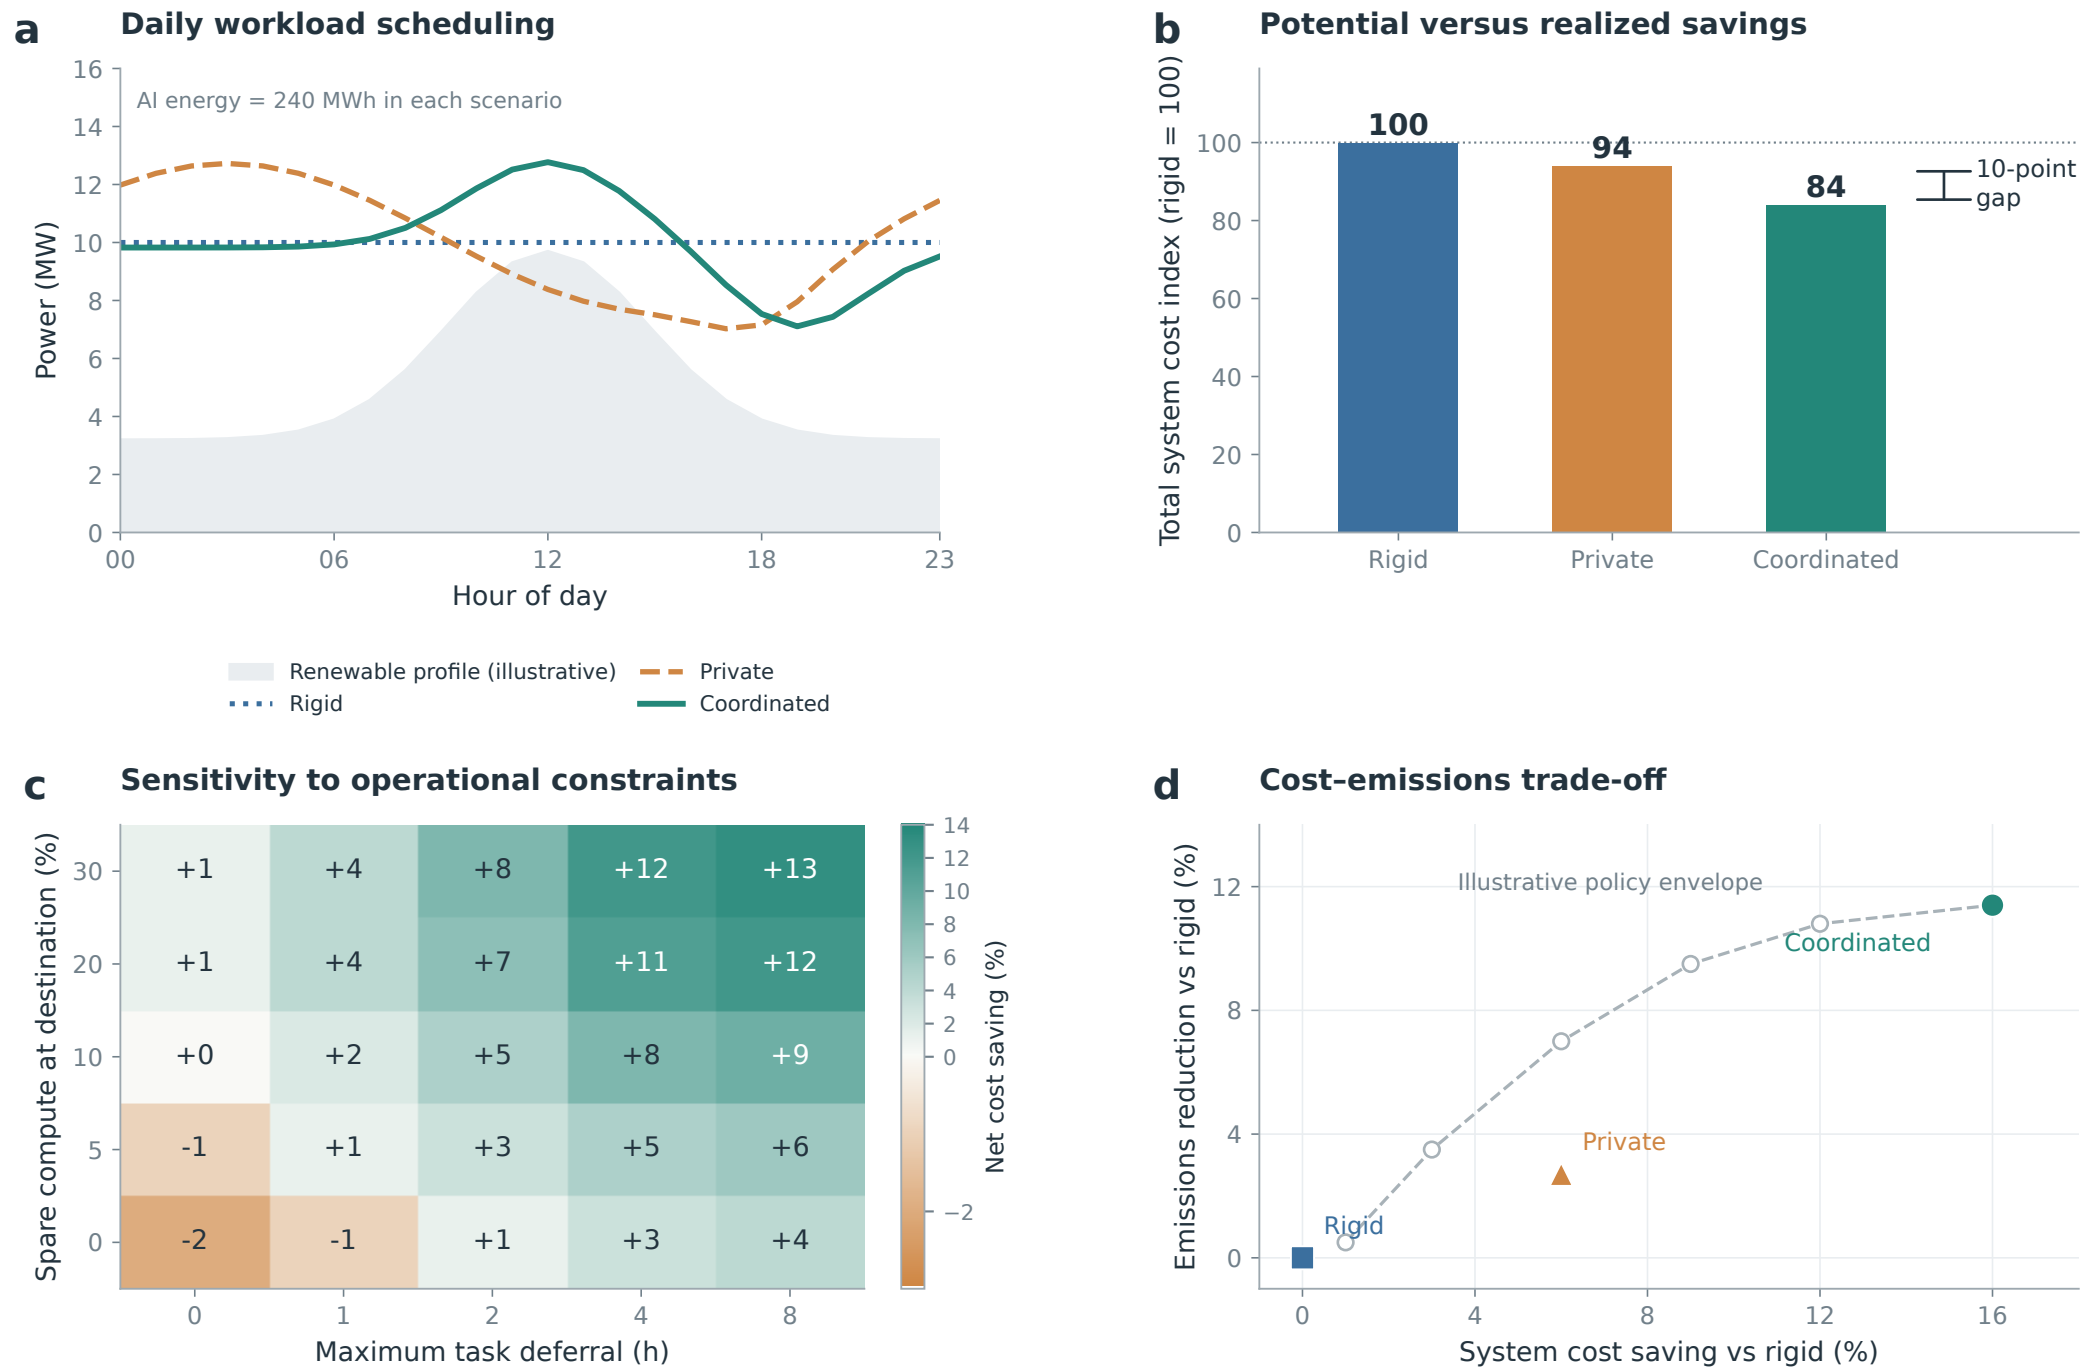

Research question

How much technically feasible flexibility becomes real system value — and under which rules?

FIGURE 02

The value and limits of AI load flexibility

Synthetic demonstration | A four-panel results figure, ready for replacement with model outputs

ILLUSTRATIVE MOCK / All numbers are synthetic; no empirical findings or uncertainty estimates.
