

Power-boundary assumptions change the estimated value of flexible computing

Conditional model diagnostics | corrected pumped storage | full foresight | four representative weeks

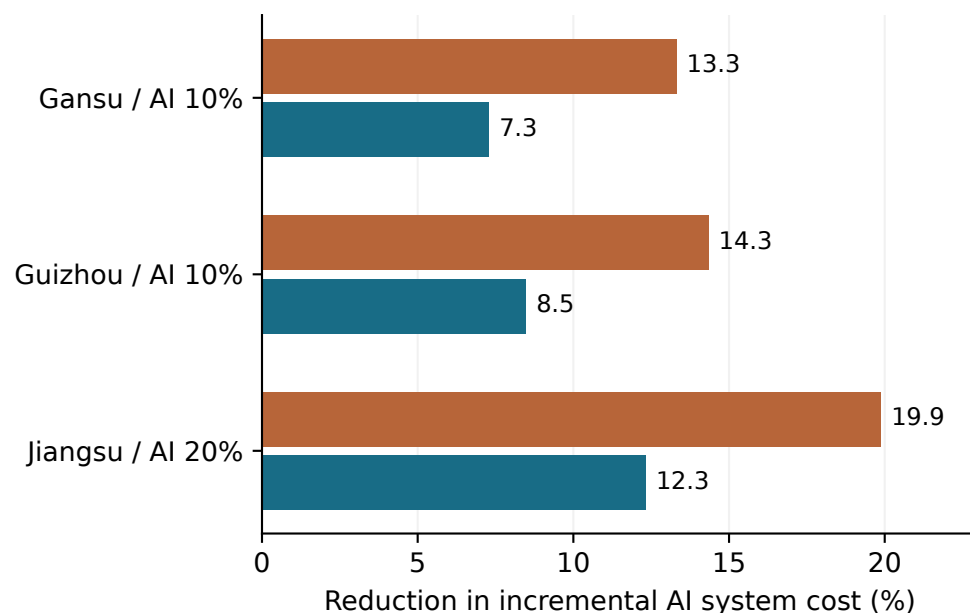

a Jiangsu: cost benefit

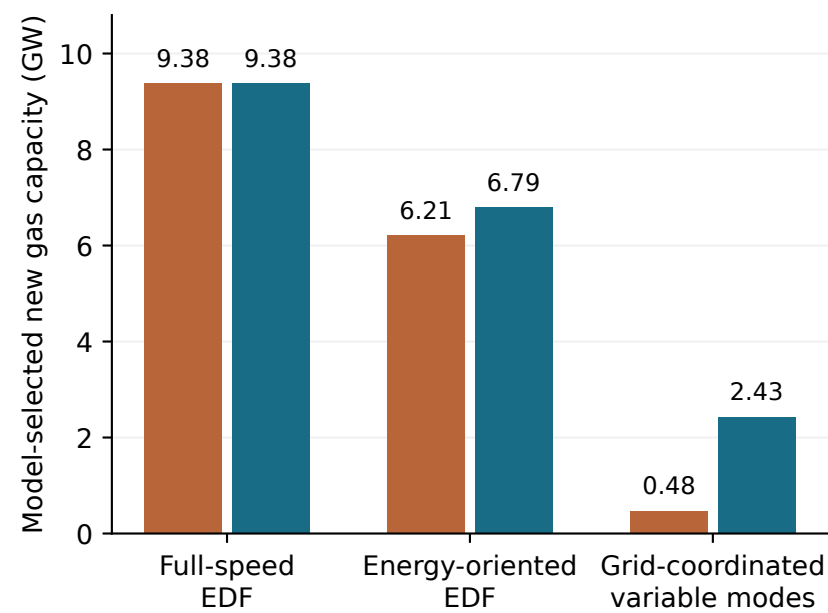

b Jiangsu: policy attribution

c Fine-tuning / Dolly across regions

d Jiangsu / Dolly: capacity sensitivity

■ Direct GPU-ratio mapping (historical) ● Component mapping (assumed $l=0.41, g=0.10, d=0$)

All values are conditional simulations, not calibrated whole-node estimates or firm-capacity credits. No confidence intervals are available.

* The 32- and 48-GPU configurations have identical normalized curves; these are not independent workload replications.
