

The attribution changes when service decision rights are explicit

Same real jobs and background | fixed-start vs flexible-start × full-speed vs variable-mode | retrospective information

Panel a: allocations over feasible heuristic policies. Panel b: whether deterministic bounds prove an optimal share above/below 50%.

These are different quantities. Neither is a confidence interval or a universal physical split of efficiency and flexibility.

GPU-only assumed power boundary; historical relative tariffs on an assumed trace clock. No whole-node, system-cost or capacity claim.
